Highlights

The Expenditure measure of GDP (GDP-E) show how goods and services produced in the economy are used by the economic agents (institutional sectors) in the country. The GDP-E is published in nominal (current) market prices and at constant 2006 prices.

The growth rate for GDP-E declined to 7.9% in 2012 from 15% in 2011.

The main contributors to the growth are:

1. Household final consumption grew by 9.2% compared to 12.9 % growth rate in 2011.
2. Government Final Consumption Expenditure grew by 5.1%. This is partly due to the base drift effect of the Single Spine Salary Structure implementation in 2011.
3. Imports grew by 15.8%. The largest contribution came from imports of equipments (transport and Machinery)
4. Exports grew by 9.5%. Increased exports of Gold, and Cocoa beans and products were the largest contributors in 2012.
5. Gross Fixed Capital Formation grew by 18.8%. This was due to increased investment in equipment (Transport and Machinery), and Oil exploration.
6. Government Final Consumption Expenditure grew by 5.1%. This is partly due to the base drift effect of the Single Spine Salary Structure implementation in 2011.

2.2 GDP by expenditures at 2006 constant prices (new series)
