PREFACE

The mandate of the Ghana Statistical Service (GSS), like many other national statistical offices, includes data collection, compilation and analysis as well as dissemination of statistical information in an accessible and user-friendly manner. To satisfy the needs of users, GSS has shifted from a producer centred statistics generation approach to focus on what users require. There is also the need to disseminate widely all the statistics produced by GSS so that all data users can have access to it.

The 2021 Population and Housing Census (PHC) is a decennial activity conducted to provide updated demographic, socioeconomic and housing data for research, policy and planning to support national development activities. Census information is critical for tracking the implementation of national, continental and global development goals. Between the 2021 PHC and the next census, there is a need for updated population information to provide the needed statistics to measure these developmental goals. The Ghana Statistical Service has computed population projections to offer insights into the future demographic landscape, informing policymakers, researchers, and the public about potential changes.

The Population Projection 2021-2050 report, estimates Ghana's future population, providing the demographic changes that reflect the country's developmental challenges. This report provides information on various variants of projecting the national population by sex and type of locality, single years of age, projected regional figures by sex and type of locality, projected district figures by sex and single years of age, projected constituency population by sex to meet the diverse needs of data users.

GSS recognizes the importance of making accurate, relevant, and timely census information available which serves as an invaluable resource of Ghana's population dynamics to guide national development. The disaggregated 2021-2050 projected population aim to foster collaborative as well as intersectoral approaches in planning development targets and design policies for national development.

ACKNOWLEDGEMENTS

Ghana Statistical Service (GSS) wishes to thank the Government of Ghana, former Presidents, members of the National Census Steering Committee, National Census Technical Advisory Committee, National Census Publicity, Education and Advocacy Committee and the Regional and District Census Implementation Committees for their commitment and dedication to ensuring a well-coordinated census operation.

The Service is indeed grateful to the Ministry of Finance, Ministry of Education, Ghana Education Service (GES), Ministry of Information, Information Services Department, Ministry of Local Government, Decentralisation and Rural Development, Local Government Service, and the various District Assemblies, National Identification Authority, Ministry of Defence, Ghana Armed Forces, Ministry of Interior, Ghana Police Service, Ghana Immigration Service, Ghana Civil Aviation Authority, Ghana Airports Company Limited, Ghana Fire Service, Ghana Prisons Service, Ministry of Health, Ghana Health Service, Ministry of Foreign Affairs and Regional Integration, National Commission for Civic Education (NCCE), Electoral Commission (EC), Office of Government Machinery, Ministry of Parliamentary Affairs, Parliament, Ministry of National Security, National Sports Authority, National Communication Authority, Ghana Highways Authority, Survey Department, Ministry of Sanitation and Water Resources, Ministry of Food and Agriculture, Births and Deaths Registry, Religious and Traditional Leaders, individuals and all other organisations that provided the needed support to enable GSS execute this essential national exercise.

We are also indebted to our develop partners and collaborators, notably the United Nations Population Fund (UNFPA), World Bank, European Union (EU), International Organisation for Migration (IOM), United Nations Development Programme (UNDP), United Nations Economic Commission for Africa (UNECA), United Kingdom Office for National Statistics (ONS), Statistics Denmark, Geo-Referenced Infrastructure and Demographic Data for Development (GRID3), Josphong Group of Companies, IPMC Ghana, telecommunication companies, Cal Bank, Windy Lodge Beach Resort, and tertiary institutions for their technical, logistic, financial support, publicity, education, and advocacy campaigns that led to the effective and efficient management of the census processes. GSS also appreciates the contributions of the general public, the media, all Census officials and field officers for ensuring a successful enumeration.

Finally, GSS is grateful to subject matter specialists who gave useful comments and inputs during the formulation of the assumptions to guide this population projections as well as all team members who spent time in validating, working on the final tables, formatting and the review team.

1 INTRODUCTION

The 2021 Population and Housing Census (PHC) is a complete enumeration of all persons and structures in the country as at Census Night, 27th June, 2021. The census was implemented to provide reliable and accurate data for evidence-based decision making to support the implementation and tracking of progress on national, continental, and global development agenda. The 2021 PHC provided information on the size, distribution, composition, structure, housing conditions and other characteristics of the population, which are useful for planning and policy formulation by Ministries, Departments and Agencies (MDAs), as well as researchers, academia, civil society organisations (CSOs) and the private sector.

Ghana, like most developing countries, undertakes censuses at decennial intervals, unlike some developed countries that conduct censuses every five years or use administrative data to provide current population estimates, when necessary. These decennial data collections provide statistics at a point in time, and do not account for the continuous change in population over time. Consequently, there is the need to provide information on population changes during intercensal periods to inform planning and development initiatives. Population projections also assist in monitoring and evaluating progress towards achieving the tenets of the National Long-Term Development Policy Framework, 2057; Agenda 2063 - The Africa We Want and Transforming Our World; and The 2030 Agenda for Sustainable Development.

Population projections are constructed approximations of the future size and characteristics of the population based on specified sets of assumptions regarding the expected trends of fertility, mortality, and migration. They are important for government institutions, researchers and the private sector in estimating and planning for the needs of all sectors of the economy in the short, medium and long term. Population projections assist in determining the future social, economic, education, and health needs of a society by age, sex and spatial distribution.

In undertaking population projections two imperatives are essential namely, quality population base data and the assumptions that guide the future levels of the components of population change (fertility, mortality and migration). The characterisation of the reliability of the projected population rests on two main rules of thumb: i. the shorter the projection period, the more reliable the estimates; ii. the larger the geographic area the more reliable the projections. Like other estimates, population projections should aim at reducing the margin of error in the estimation process.

The 2021-2050 Ashanti Region's Population Projections Report presents the definition of concepts, sources of data, data evaluation, assumptions, projection methods, limitations, justification for the projections and highlights of the projected figures at the national, regional and district levels. The regional projections have been disaggregated by sex, age and type of locality.

Links to the detailed projected figures in single years, by age, sex and type of locality at the national, regional and district levels have been provided.

2 DEFINITION OF CONCEPTS, DATA SOURCES AND PROJECTION ASSUMPTIONS AND METHODS

2.1 Definition of Concepts

2.1.1 Age

Age refers to how old a person was at his or her last birthday with reference to the Census Night and is recorded in completed years.

2.1.2 Sex Ratio

Sex ratio is defined as the number of males per 100 females.

2.1.3 Age Dependency Ratio

This refers to the ratio of the population 0-14 years and 65 years and older to the population 15 - 64 years.

2.1.4 Old-Age Dependency Ratio

This is the ratio of the population 65 years and older to the population 15 - 64 years.

2.1.5 Young-Age Dependency Ratio

This is the ratio of the population 0-14 years to the population 15 - 64 years.

2.1.6 Median Age

Median Age is the age at which exactly half of the population is older, and half younger.

2.1.7 Total Fertility Rate (TFR)

This is the average number of children that would be born to a woman **(15-49 years)** over her lifetime if she were to experience the current age-specific fertility rates and survive from birth to the end of her childbearing years.

2.1.8 Life Expectancy at Birth

This is an estimate of the average number of years a person is expected to live from birth.

2.1.9 Migration

Migration is the geographic movement of people across a defined boundary for the purpose of establishing a new permanent or semi-permanent residence in another area.

Any such movement across a defined boundary within a country is referred to as internal migration. On the other hand, any movement across a defined boundary between two countries is referred to as international migration.

2.1.10 Locality

The definition of a locality for the 2021PHC is the same as used in previous census. A locality refers to an inhabited geographical area with a distinct name and defined boundaries. It could be a hamlet, mining camp, village, town or city.

2.1.11 Type of Locality

Type of locality can be classified using population threshold¹ as an urban (5,000 or more) or rural (less than 5,000) area. In this report, an urban area has been described using two definitions;

Urban¹ is a locality with a population 5,000 or more, while **Urban²**, is a locality with at least 5,000 population, and in addition; at least 75 percent of the inhabitants have access to electricity, 50 percent with access to potable water, available health facility (clinic or better), and access to educational facility - at least Basic School (JHS).

2.1.12 Administrative Area

These designations (District, Municipal, Metropolitan) are subject to the geographical contiguity and economic viability of the area, namely, the ability of an area to provide the basic infrastructural and any other developmental needs from the monetary and any other resources in the area.

2.1.12.1 District

Refers to an administrative area that has a minimum population of 75,000.

2.1.12.2 Municipal

Refers to an administrative area with a minimum population of 95,000 but less than 250,000.

2.1.12.3 Metropolitan

Refers to an administrative area with a minimum population of 250,000.

¹ Using population 5,000 threshold alone is comparable to previous censuses.

2.2 Sources of Data

Fertility, mortality and migration levels and trends are the core information needed for determining the future population size and structure. The statistics presented in this report are generated from the 2021 PHC. Statistics on trends are complemented with data from the various rounds of population censuses between 1960 and 1984, as well as the population and housing censuses of 2000, 2010 and 2021, the 1971 Supplementary Enquiry, the 1979/80 Ghana Fertility Survey, the eight rounds of the Demographic and Health Surveys (1988 - 2022), and the Ghana Maternal Health Surveys of 2007 and 2017.

2.3 Census Data Evaluation

Population data, like all other demographic statistics, whether obtained from censuses, surveys or administrative records, are subject to errors. The magnitude of the errors may depend on how accurately the information was recorded and the extent of completeness of the coverage of the study area. The most pronounced errors are related to age and sex. To generate accurate and reliable population projection estimates for the period 2021-2050, it is important the base data (2021 PHC) for the estimation is evaluated to determine the accuracy of the information. This section describes the steps taken to appraise the accuracy of the 2021 PHC data.

The 2021 PHC planning, and data collection were guided by and conformed to the Principles and Recommendations for Population and Housing Census (United Nations, 2017). The validation examined the consistency of the data by comparing the observed data with one or more censuses as well as comparison with theoretical expected configurations.

2.3.1 Comparison with Previous Census Data and Projections

Age and sex data play an important role in any demographic analysis and in planning. It is required that in any census, the extent of misreporting is identified to facilitate analysis based on age and sex. Population projections basically draw on age and sex to make the future estimates. If there are pronounced errors in the age and sex data, it will render the projection inaccurate. The errors in the age-sex data, are basically due to digit preference and avoidance as well as age misstatement especially at older ages. Visual inspection, including graphical presentation was used as an approach to identify errors arising from digit and age preference and other errors (Figure 2.1).

The lines represent each census year and show how the population born in the same period and enumerated in each successive census reduces through time. The three lines for the successive censuses should follow the same pattern, i.e., run parallel to each other. The chart shows that the 2021 PHC followed the expected pattern of a steady and gradual decline in the ages as observed from the age group 5-9 to 20-24. However, the proportion of children for age group 0-4 was lower than that for the 5-9 group. This means there is age misreporting where children four years may have been shifted to age five years due to digit preference, thus heaping the 5-9 age group, or due to migration where

children have come in with their parents, or possible underreporting of children at lower ages. The small dip for the age group 55-59 years suggests age misreporting due to digit preference resulting from rounding up ages to those ending in zero.

FIGURE 2.1: CENSUS POPULATION IN 5-YEAR AGE GROUPING, 2000 - 2021

Source: 2021, 2010 and 2000 PHC

2.3.2 Analysis of Age and Sex Ratios at Birth

Another approach adopted to examine the accuracy and reliability of the 2021 PHC age and sex data is to compare with known theoretical configurations. Sex ratio at birth is defined as the number of male births per 100 female births in a population. For most populations, there are more male than female births. A comparison of the 2021 PHC with 2010, 2000 and 1984 censuses shows that 2010 and 2021 were consistent with the expectation of having more males at birth than females compared with that of the 2000 (Table 2.1).

TABLE 2.1: SEX RATIOS AT BIRTH, GHANA, 1984 - 2021

Sex ratio at birth	1984	2000	2010	2021
	100.0	99.6	102.6	102.8

Source: The 2021, 2010 and 2000 PHC reports

2.3.3 Age and Sex Accuracy Index

Another method of checking the quality of age data is through the calculation of age ratios. Age ratio is usually defined as the ratio of the population in each age group to one-half of the population in the two adjacent age groups, and is computed by sex. To examine the quality of the base data, the information of the 2021 PHC was compared

to that of 2010 and 2000, and the results are presented in Table 2.2. The table shows that male and female age ratio scores for the 2000 PHC were 6.05 and 9.02, respectively. Similarly, the age ratio scores for males in the 2010 PHC was 5.79 while that of females was 7.92. The respective age ratio scores for males and females in the 2021 PHC were 4.5 and 5.4, respectively. According to this measure of accuracy, age misreporting was slightly higher among females than males. It also supports the observation that the 2021 data were more accurate than the 2010 and 2000 data.

TABLE 2.2: UNITED NATIONS AGE ACCURACY INDEX, 2000 - 2021

Index	2000	2010	2021
Age ratio score for males	6.05	5.79	4.5
Age ratio score for females	9.02	7.92	5.4
Sex ratio score	7.11	4.34	3.2
Age-sex accuracy index	36.4	26.7	19.4

Source: Computed from the 2000, 2010 and 2021 PHC

Another means to evaluate the census data is the joint use of age ratios and sex ratios. These ratios can be combined to assess the accuracy of sex and age reporting in the 2021 PHC data. The indices resulting from this combination are the age ratio score, the sex ratio score and the age accuracy index. The sex ratio score is defined as the mean difference between sex ratios for successive age groups and averaged, ignoring any negative signs. The age ratio score, on the other hand, is defined as the mean deviations of the age ratios from 100 percent, again ignoring any negative signs. The joint score or age accuracy index is defined as the sum of the male and female age ratio scores plus three times the sex ratio scores calculated using data for ages 0-14 through 65-69 years. The United Nations suggests that the age and sex structure of a population is considered accurate if the joint score is less than 20, inaccurate if the index is between 20 and 40; and highly inaccurate if the index is greater than 40.

The results of the computation of the age accuracy Index for the three most recent PHCs show that the age accuracy index were 36.4, 26.7 and 19.4 in 2000, 2010 and 2021, respectively (Table 2.2). The results indicate that age reporting in the 2021 PHC was the most accurate compared to that in 2000 and 2010. Although both 2000 and 2010 were less accurate by the United Nations' Index, the age reporting for 2010 was an improvement over that of the 2000 PHC.

Overall, the analyses suggest that age reporting in the 2021 PHC data was better than the previous censuses. In terms of sex, age reporting was better for males than females. Based on the evaluation using the United Nations Accuracy Index generated (19.4) is lower than the 20.0 threshold for accuracy, and therefore, the 2021 PHC data were considered as reliable and so used for the projections without any further adjustments.

2.4 Projection Assumptions

2.4.1 Fertility

Globally, the age at which people enter first union has increased in recent decades (Cherlin, 2014; Ortega, 2014; GSS and ICF, 2024; Odame et al., 2019). For instance, in monitoring the United Nations World Marriage Data (1970-2008) for 217 countries, Ortega (2014), observes that there has been a postponement of marriage by an average of two years since the 1970s. The postponement is evidenced by the fact that many women are now entering into marital unions at older ages as shown by the increasing proportions of women at each age group that are not married.

Current fertility, measured in terms of TFR, indicates a gradual downward trend as presented in Table 2.3. Estimates derived from the datasets spanning a period of 60 years show that the level of fertility was high and stable in the first few decades after independence (1960s, 1970s and early 1980s). The table shows that a woman during those years had an average of 6.9 children, dropping slightly to 6.4 by the end of the 1980s. The 1990s experienced the sharpest decline by almost two children (4.6 children in 1998), decreasing further by 0.7 child over the following two decades to 3.9 in 2017. It is important, however, to note that there are some differences in the Demographic and Health Survey fertility estimates and those obtained from the censuses. The differences stem from the fact that the censuses collect fertility data in the preceding 12 months while that of the DHS reflects births in the 36 months before the survey.

TABLE 2.3: TOTAL FERTILITY RATES, GHANA, 1960-2021

Period	TFR
1959 – 1960*	6.5
1967 – 1968***	6.6
1970 – 1971*	6.9
1979 – 1980***	6.4

* Census; **GDHS/MMHS; ***GFS

Fertility transition is a global phenomenon, although the pace of decline is much slower in some sub-Saharan African (SSA) countries compared to others in the developed

regions. The key drivers of this transition are macrolevel structural and economic changes and microlevel cultural value orientations (Avogo and Somefun, 2019). In SSA, fertility and household size changes appear to be closely linked to socio-economic dynamics and union formations. In Ghana, median age at marriage and childbearing has steadily increased (GSS & ICF 2024). While median age at first marriage among women aged 25 – 49 years increased from 18.5 years in 1988 to 21.8 years in 2022, median age at childbearing among the same age group has risen from 19.4 years in 1988 to 22.1 years in 2022 (GSS & ICF 2024). Similarly, family planning use among all women (15-49 years) has increased from 12.3 percent in 1988 to 31.5 percent in 2022 (GSS & IRDM Inc., 1989; GSS & ICF 2024).

Ghana is an intermediate-fertility country, suggesting that it is experiencing fertility decline but the level of fertility is still above replacement level (2.1 children per woman).

2.4.1.1 High Fertility Assumption

The fertility level estimated for 2019-2021 is 3.67 and is assumed to remain constant throughout the projection years (Table 2.4). The assumption is based on the consideration that past fertility trends especially between 2003 and 2014 have shown TFR to have remained almost constant at about four children per woman. The other considerations underpinning the assumption are low levels of modern contraceptive prevalence and unmet need for family planning, which declined from 16.5 percent in 1998 to 15.9 percent in 2022 (GSS and Macro Int., 1999; GSS and ICF, 2024). It is, therefore, projected that fertility will continue to remain constant at 3.67 children per woman.

2.4.1.2 Medium Fertility Assumption

It is assumed that TFR will decline from 3.67 at the beginning of the projection period to 2.67 at the end (Table 2.4). In arriving at this assumption, future fertility trends were determined by fitting a logistic function to the estimated TFR values from 1977 to 2021. The logistic curve fits many types of growth data much better than that of other curves such as the exponential curve. It has been demonstrated that logistic curves possess certain predictive values and that future estimates derived by means of logistic extrapolation, have in many cases, been reasonably confirmed by actual observations as censuses were taken subsequently (United Nations, 1961; Smith et al., 2013).

2.4.1.3 Low Fertility Assumption

The low variant approach assumes that TFR will decline from 3.67 in 2021 to 2.25 in 2050 (Table 2.4). This assumption was informed by several considerations, including anticipated further increase in age at first marriage and childbearing among women of reproductive ages (15-49 years), increased female education mainly due to the free senior high school education policy, sustained family planning uptake, all of which will result in a relatively faster decline of completed fertility of women aged 44-49 years.

TABLE 2.4: DERIVED TOTAL FERTILITY VARIANTS USED IN THE PROJECTIONS, 2021-2050

Period (Years)	High Variant	Medium Variant	Low Variant
2021 - 2024	3.67	3.67	3.67
2025 - 2029	3.67	3.39	3.25
2030 - 2034	3.67	3.19	3.00
2035 - 2039	3.67	3.01	2.59
2040 - 2044	3.67	2.94	2.38
2045 - 2049	3.67	2.83	2.34
2050	3.67	2.67	2.25

2.4.2 Mortality

The level of infant and child mortality in a country is used as the measure of the country's level of development (Moultrie et, al., 2013). Information on household deaths in the last 12 months preceding the census night was analysed to determine the pattern of mortality by age and sex. Information on the proportion of deaths among children below five years provides estimates of infant and child mortality, which is used to determine the future mortality trend of the population. However, the analysis indicated very high survivorship among some age groups, which suggested some underestimation of deaths at the household level. In view of this, the under-five mortality (q5) was selected for the determination of the mortality pattern of the population because it is particularly sensitive to the mortality patterns underlying the different scenarios.

The under-five mortality pattern of Ghana was assumed to reflect the North Model of the Coale and Demeny pattern of mortality levels 22 and 23 for males and females respectively (Coale and Demeny, 1966). Therefore, Brass Relational Gompertz indirect estimation logistic function was fitted to the estimated under-five mortality (q5) values and the implied life expectancies at birth for the period 2021-2050 presented in Table 2.5. Based on models for mortality improvement, quinquennial gains in life expectancy at birth were used for the high, medium and low variants, with the estimated life expectancy in 2021 as the base. For example, Table 2.5 shows that there was a gain in the male life expectancy of 0.37 years per year under the low variant from 2021 to 2025, which is not too different from what Coale and Demeny have incorporated in their models.

The high variant indicates lower survivorship while the low variant is indicative of higher survivorship (Table 2.5). The table shows higher survivorship for females than males for the projection period and across all variants. It is also seen that the high variant value for males, 63.3 years in 2021, will increase by 5.1 years, reaching 68.4 years in 2050. On the other hand, the corresponding gain for females will be 6.0 years over the projection period. For the low variant, it is observed that males will gain 8.3 years compared to 9.4 years for females over the same period.

TABLE 2.5: PROJECTED LIFE EXPECTANCY AT BIRTH BY SEX, 2021-2050

Period (Year)	Low Variant		Medium Variant		High Variant	
	Male	Female	Male	Female	Male	Female
2021	63.3	66.8	63.3	66.8	63.3	66.8
2025	64.8	68.6	64.5	68.1	64.1	67.8
2030	66.6	70.5	65.8	69.6	65.1	69.0
2035	68.1	72.3	67.1	71.0	66.0	70.0
2040	69.4	73.8	68.2	72.2	66.8	71.0
2045	70.6	75.0	69.2	73.3	67.6	71.9
2050	71.6	76.2	70.2	74.3	68.4	72.8

2.4.3 Migration

Migration has been an enduring component of the world's history and demographic process (GSS, 2023). Migrants move within their own countries and between countries; some move for short periods, others permanently; some are forced to move, others do so voluntarily; some people move with high levels of financial and human capital while others are not so well endowed. People move from one place to another for several reasons, some of which include improvement in living conditions, taking advantage of economic opportunities, political and social conflicts, drought and other environmental problems (GSS, 2023; GSS, 2022). The migration projection constitutes the last segment of the cohort component approach as one of population projection processes. In this report, the analysis is limited to international migration.

The assumption about the future levels of international migration was based on data from the 2021 PHC to estimate net international migration. Migration flows often result from short-term changes in economic, social, political, or environmental factors that are difficult to anticipate. Census information from households about members who have been living continuously or intend to live outside Ghana for at least 12 months and non-Ghanaians living in the country. This provided insights into the number of persons moving in and out of the country by age and sex. The net migration figures reflect a male population deficit of 10,021 and a female population gain of 10,946. These figures indicate that Ghana is having a net loss of male population through migration and the reverse is true for females.

The projections considered age-specific migration rates, which provided information on the distribution of the international migrant population by age and sex (Table 2.6). The 2010 PHC collected information on emigrants 15 years and older, whereas the 2021 PHC obtained information on all persons. In view of this, the analysis to develop the migration assumption was limited only to the migration patterns captured in the 2021 PHC. Similarly, the future levels of migration were held constant over the projection period because of the unpredictability of migration in the long term.

Table 2.6 shows the percentage distribution of international migrants by age and sex. The table reveals that while the males are heavily concentrated within ages 20 to 44 years, the females are more within 20 to 39 years.

TABLE 2.6: PERCENTAGE DISTRIBUTION OF INTERNATIONAL MIGRANTS BY AGE AND SEX

Age group	Male	Female
0-4	4.0	6.4
5-9	3.6	5.8
10-14	3.0	4.6
15-19	5.7	7.5
20-24	11.7	12.4
25-29	14.9	13.7
30-34	14.6	13.3
35-39	12.7	10.7
40-44	10.1	8.1
45-49	7.3	5.9
50-54	5.4	4.5
55-59	2.8	2.5
60-64	2.0	2.0
65-69	1.0	1.0
70-74	0.6	0.7
75-79	0.3	0.4
80+	0.3	0.5
Total	100.0	100.0

2.5 Projection Methods

Different methods are usually used for population projections including trend extrapolation, ratio methods, and cohort component methods. For purposes of this report, however, the cohort component method was used to make the projections at the national level, while the ratio methods were adopted for the subnational level projections. On the other hand, trend extrapolation and regression models (Gompertz Relational and Logistic regression) informed the choice of the various projection assumptions.

2.5.1 Trend Extrapolation

Trend extrapolation methods are based on the continuation of observable historical trends. They can be simple or complex. They are often used for projecting total population but can also be used at the sub-national levels as well as for specific population subgroups (e.g., sex, type of locality, etc.). They can also be used for projecting the different components of population change (births, deaths and migration). Trend extrapolation methods are generally applied to single data series (e.g., total population) but can also be applied to data expressed as ratios (sub-metro or constituency shares of district populations).

2.5.1.1 Cohort Component Method

This is the most common tool in population projections at the national level. The cohort-component model is a deterministic population projection method, which does not describe uncertainty, but is based on a set of scenarios chosen to represent the most plausible future paths of migration, fertility and mortality (Smith et. al., 2013).

A cohort-component population projection requires a base population in the initial year of the projection, classified by age and sex. Age-specific assumptions on future fertility, mortality and migration rates are used to project the population, usually in single or five-year intervals. These assumptions could also be informed by the most likely response of the components of population change to the prevailing policy environment.

2.5.2 The Ratio Method

This approach was adopted at the sub-national level. Under this technique, the population or population change of a smaller area is expressed as a proportion of the larger area. The area or segments to be projected should be mutually exclusive and exhaustive. In this report, three dimensions of the ratio method of population projections were used: constant share, shift share and share of growth.

The constant share approach of the population projection estimates the population of the smaller area as a share of the larger population and is held constant over the projection horizon. This approach was employed to project the population of areas with changing geographic boundaries, thereby making it difficult to construct a reliable historical data series. The shift-share approach on the other hand, considers the changes in population share over time in estimating the population of the smaller area over the projection period. The share of growth method deals with shares of population change or growth rate rather than population size. The method considers the contribution of the smaller area to the growth rate of the larger area and draws on the historical data points. This technique is more useful in situations where the smaller area has not grown at the same rate historically over the period to allow for a more accurate estimation of the area's future population.

2.6 Projection Processes

The cohort component method was utilised in the construction of the national projections of the total population under the three fertility assumptions, low, medium and high. Figure 2.2 shows that Ghana's population is projected to increase from 30.83 million in 2021 to 48.45 million, 52.46 million and 58.77 million in 2050 under the low, medium and high variants, respectively. The projections indicate that the high variant scenario will produce 10.4 million additional population in 2050 compared to that under the low variant.

By convention the medium variant tends to produce the most realistic projections to reflect the future population. The medium variant projections indicate that the country's

total population will increase by 6.41 million during the decade 2021-2030, 13.63 million and 21.63 million by 2040 and 2050, respectively.

FIGURE 2.2: PROJECTED POPULATION OF GHANA BY VARIANT, 2021-2050

The medium variant approach of the population projections generated estimates for the national level in single years over the projection period as well as by sex and single ages, 0 through 80+. As regards the type of locality projections at the national and regional levels, the share of growth ratio method was adopted. The method using the intercensal trend and the differences between the urban and rural growth rates yielded reasonable results. The proportion of the urban population is projected to increase from 56.7 percent in 2021 to 60.7 percent in 2030 and 66.2 percent in 2050.

The projections by region and type of locality were derived from the independently constructed national population projections using the ratio method. This method is a highly practical procedure for estimating and projecting regional and district populations (Smith et al., 2013; GSS, 2014). The projected populations in single years of age and by sex for the regions and districts were proportionately adjusted to the national and regional totals, respectively, through iterative processes.

2.7 Limitations

The lower levels of projections are subject to greater margins of error than for the district, region and national levels. This is because population trends are more irregular for smaller areas than larger ones. Similarly, the size of an area and its rate of growth are factors that

might systematically affect the accuracy of the population projections over the long term.

Additionally, errors tend to vary directly with the length of the projection period such that projections spanning over 20 years may tend to produce relatively less accurate results. This is because of greater likelihood of unforeseen developments, that can adversely affect the reliability of the projection. Thus, projections at the sub-national level should be prepared over a shorter period. It is, therefore, recommended that the projections beyond 2040 should be used with caution.

Finally, all the assumptions about the components of population change are based on historical trends. Factors that might influence the levels of fertility, mortality and migration, policy decision for example, cannot be predicted with any degree of certainty. Therefore, the population projections did not consider the impact of socio-economic development on the components of population change. Nevertheless, the projections serve as reliable approximations of the future population when comparable figures for regions or districts are required for formulating regional or district level development plans.

3 JUSTIFICATION FOR THE POPULATION PROJECTIONS (2021-2050)

Population projections are important tools for informing development planning activities and policy decision making at the national and sub-national levels. Development planning focuses on the attainment of improved quality of life for the general population both at present and in the future. Population projections, therefore, provide information on the future dynamics of the population regarding the rate of growth, age-sex composition and spatial distribution based upon which development planning decisions are made. Population projections play important roles in the development agenda of the nation.

3.1 Presenting Alternative Development Planning Scenarios

Projections can be used not only to analyse the determinants of population change, but also to give an indication of possible future scenarios that will form a critical basis for planning activities. Projections present different development paradigms to guide choices that are made regarding the development planning objectives, strategies to be adopted, and related activities to be performed to achieve set targets. The projections provide development planners the opportunity to assess alternatives to make informed decisions. Against this background, the report presents three scenarios of projections at the national level, namely, low, medium and high variants.

3.2 Promoting Development Agenda

Projections can also be used to support a particular political or socio-economic agenda. Here the emphasis is on being intentional in integrating population variables functionally into the development agenda of the country. For example, suppose that the growth of a district population has been projected at 2.5 percent per annum in the next decade, it could serve as a guide for the district managers or administrators to adopt intervention programmes to address any challenges that may be associated with the projected growth, or take advantage of any opportunities it may present.

3.3 Promoting Advocacy

Population projections can be used for advocacy purposes. For example, in the field of education, the projected school-going age population at the different levels could serve as a good basis to advocate for specific interventions to ensure expanded access to education for all. Again, population projections that demonstrate an ageing population could serve as a basis for relevant advocacy actions towards strengthening social interventions for older persons, especially for those in the informal economic sector.

3.4 Providing a Basis for Other Projections

Population projections are used as a basis for making other sectoral forecasts such as in education, health, labour force participation, housing, water and sanitation. For example, population projections can be used to determine school enrolment by

applying enrolment rates to the appropriate age groups. Similarly, population projections can be used for labour force projections by applying labour force participation rates to the appropriate age and sex. They can also be used for projecting the number of births by applying birth rates to the projected female population.

4 REGIONAL PROFILE

According to the 2021 PHC, Ashanti Region, which has since 1960 been the most populous in Ghana lost its position to the Greater Accra Region. The region's population was 5.44 million, with a little more than half (50.7%) being females (2.76 million), while males represent 49.3 percent (2.68 million). The region occupies a total land area of 24,389 square kilometres with a population density of 223 persons per square kilometre.

Ashanti Region shares boundaries with six regions: Bono East, Bono, Ahafo, Western North, Central and Eastern. Lake Bosomtwe, the only natural lake in the country, is in the region. It also hosts tourist sites such as, Bobiri Butterfly Sanctuary, Komfo Anokye Sword Camp, Manhyia Palace and its Museum and Military Museum.

The region has 43 administrative areas, made up of one Metropolitan, 19 Municipal and 23 District Assemblies (Table 4.1). Forty-seven of the country's 275 electoral constituencies are also in the region.

TABLE 4.1: TYPE OF ADMINISTRATIVE AREAS IN THE ASHANTI REGION

Metropolitan	Municipal	District
1. Kumasi Metropolitan (KMA)	1 Ahafo Ano North	1 Adansi Asokwa
	2 Asante Akim Central	2 Adansi North
	3 Asante Akim North	3 Adansi South
	4 Asante Akim South	4 Afigya Kwabre North
	5 Asokore Mampong	5 Afigya Kwabre South
	6 Asokwa	6 Ahafo Ano South East
	7 Atwima Nwabiagya	7 Ahafo Ano South West
	8 Bekwai	8 Akrofuom
	9 Ejisu	9 Amansie Central
	10 Ejura Sekyedumasi	10 Amansie South
	11 Juaben	11 Amansie West
	12 Kwabre East	12 Atwima Kwanwoma
	13 Kwadaso	13 Atwima Mponua
	14 Mampong	14 Atwima Nwabiagya North
	15 Obuasi	15 Bosome Freho
	16 Offinso	16 Bosomtwe
	17 Oforikrom	17 Obuasi East
	18 Old Tafo	18 Offinso North
	19 Suame	19 Sekyere Afram Plains
		20 Sekyere Central
		21 Sekyere East
		22 Sekyere Kumawu
		23 Sekyere South

The Akan ethnic group (71.7%) is the largest in the region, followed by Mole-Dagbani (12.4%), Gurma (3.8%), Ewe (3.5%), with the remaining ethnic groups constituting 9.2 percent.

Almost four in five (78.1%) of the region's population are affiliated to the Christian Religion and 16.0 percent to the Islamic Religion. Less than two percent either belong to other religions (0.9%) or are traditionalists (0.4%). The rest (4.6%) profess to have no religion.

Ashanti Region has a literacy rate of 78.0 percent of the population 6 years and older, which is higher among the males (82.0%) than females (74.2%). The literacy rate is also higher in the urban (84.0%) than rural (68.1%) areas. Thirteen percent of the population 4 years and older have never attended school, 41.6 percent are attending now, and 45.4 percent attended school in the past.

The services sector is the most dominant in the region, and accounts for nearly three-fifths (58.3%) of the employed population 15 years and older, while the agriculture and industry sectors represent 26.5 percent and 15.2 percent, respectively.

5 HIGHLIGHTS

Ashanti Region, with a land size of 24,389 square kilometres, had a total population of 5,440,463 in 2021, which is 4.9 times that of the 1960 population (1,109,133).

The population is projected to increase to 6.13 million in 2030, 6.90 million in 2040 and 7.75 million in 2050.

The projected population between 2021 and 2030 indicates that, on average, 76,101 persons will be added each year.

FIGURE 5.1: POPULATION SIZE, 1960 - 2050

Ashanti Region's population structure is changing from largely children 0-14 years to a youth population with the proportion of children decreasing from 42.0 percent in 2000 to 37.7 percent in 2010 and 34.5 percent in 2021.

The youth population 15-35 years increased from 33.8 percent in 2000 to 38.2 percent in 2010 and 39.1 percent in 2021.

The region's population structure is projected to change with the proportion of the youth will be 37.2 percent by 2035.

FIGURE 5.2: POPULATION PYRAMID, 2000 - 2035

There are slightly more females in the region, constituting 2,760,549 (50.7%) in 2021 than males, representing 2,679,914 (49.3%).

The female population is projected at 2.88 million in 2024, 3.11 million in 2030 and 3.96 million in 2050, while that of males is projected to be 2.79 million, 3.01 million and 3.80 million, over the same period.

FIGURE 5.3: PROJECTED POPULATION BY SEX, 2021-2050

Thirteen districts, KMA, Kwabre East, Atwima Kwanwoma, Afigya Kwabre South, Oforikrom, Asokore Mampong, Ejisu, Bosomtwi, Atwima Nwabiagya, Atwima Mponua, Atwima Nwabiagya North, Kwadaso and Bekwai, constituted half (50.1%) of the region's population in 2021 and this pattern is expected to continue through to 2035.

FIGURE 5.4: PROJECTED POPULATION BY DISTRICT, 2021-2035

The region's population density was 223 persons per square kilometre in 2021, projected at 236 in 2025, and is expected to increase to 267 in 2035.

There are marked district disparities, ranging from 20,880 persons per square kilometre in Old Tafo Municipal, the highest, to 10 in Sekyere Afram Plains, the lowest.

The population density of Old Tafo (20,880), which was 93.6 times that of the regional average in 2021, is projected to further increase to reach 24,994 persons per square kilometre by 2035.

FIGURE 5.5: PROJECTED POPULATION DENSITY BY DISTRICT, 2021-2035

FIGURE 5.6: PROJECTED POPULATION DENSITY DISTRICT, 2021-2035

The number of children 0-14 years in the region was 1,879,064 in 2021, projected at 1,980,617 in 2025, and is expected to further increase to 2,228,929 by 2035.

In 2021, KMA had the highest number of children, and is projected to maintain this position through to 2035.

Oforikrom Municipal is projected to have the highest percentage increase of 41.2 between 2021 and 2035, compared to Sekyere Afram Plains, with 6.7, over the same period.

FIGURE 5.7: PROJECTED POPULATION OF CHILDREN 0-14 YEARS BY DISTRICT, 2021-2035

Thirteen percent of the region's population 4 years and older had never attended school in 2021.

There are marked district disparities; highest in Sekyere Afram Plains (44.0%), which is 7.5 times that of Kwadaso (5.8%), the lowest.

FIGURE 5.8: POPULATION 4 YEARS AND OLDER BY SCHOOL ATTENDANCE STATUS AND DISTRICT, 2021

The proportion of population 4 years and older in Ashanti Region who have never attended school is projected to decline from 13.0 percent in 2021 to 11.6 percent in 2025 and further reach 11.1 percent by 2035.

Sekyere Afram Plains has the highest proportion of 4 years and older who have never attended school (41.9%) in 2025, followed by Ejura Sekyedumase (27.4%) and Offinso North (27.0%). This pattern is expected to continue through to 2035.

FIGURE 5.9: PROJECTED POPULATION 4 YEARS AND OLDER WHO HAVE NEVER ATTENDED SCHOOL BY DISTRICT, 2021 - 2035

The population of school going age 4-24 years in the region was 2,528,737 in 2021, projected at 2,639,514 in 2025, and is expected to increase to 2,899,650 by 2035.

Kumasi Metropolitan had the highest number of persons of school going age of 196,852 in 2021, followed by Kwabre East (139,430) and Oforikrom (114,173).

Atwima Kwabre South, which had the fourth highest number of persons of school going age (107,084) in 2021 is projected to be the third highest in 2035 at 123,880.

FIGURE 5.10: PROJECTED POPULATION OF SCHOOL GOING AGE 4-24 YEARS BY DISTRICT, 2021-2035

The youth population (15-35 years) is projected to have steady growth across the years, projected at 2,214,399 in 2025 and 2,439,773 in 2035.

Kumasi Metro is projected to increase from 190,408 in 2021 to 209,824 in 2035, maintaining the highest youth population among all districts. Similarly, Kwabre East is expected to rise from 113,875 in 2021 to 132,242 in 2035, while Oforikrom grows from 110,601 in 2021 to 112,209 in 2035.

FIGURE 5.11: PROJECTED YOUTH POPULATION 15-35 YEARS BY DISTRICT, 2021-2035

The projections indicate a steady increase in the working-age population, growing by 19.9% from 2021 (3,221,851) to 2035 (3,862,751).

At the district level, Kumasi Metro consistently has the highest working-age population, growing from 289,748 in 2021 to 331,282 in 2035. Other districts with significant working-age populations include Kwabre East, Oforikrom, and Atwima Kwanwoma, all experiencing growth over the years.

FIGURE 5.12: PROJECTED WORKING AGE POPULATION 15-59 YEARS BY DISTRICT, 2021-2035

The population 60 years and older in 2021 was 339,548 and projected at 361,392 in 2025 and expected to reach 420,603 by 2035.

Among the districts, the highest increase between 2021 and 2035 is expected to occur in Afigya Kwabre South with over 45 percent that of their 2021 population and Sekyere Kumawu have the lowest increase of 3.8 percent.

43 Sekyere Afram Plains	1,193	1,397	1,689	2,040

Child dependency ratio is projected to marginally decrease from 56.2 percent in 2021 to 56.0 percent in 2025 and further decline by 0.4 percentage points in 2035 (55.6%).

Eleven districts are projected to record a percentage increase in their child dependency ratio between 2021 and 2030 from 16.2 percent increase in Oforikrom to 0.1 in Obuasi East, while the others are projected to experience a decrease from 0.1 percent in Asanti Akim North to 11.1 percent in Sekyere Afram Plains.

FIGURE 5.14: PROJECTED CHILD DEPENDENCY RATIO BY DISTRICT, 2021-2035

The region's old age (65+ years) dependency ratio is projected to increase from 6.6 to 6.8 persons per 100 working age (15-64 years) between 2021 and 2035.

Twenty-three districts are projected to record a percentage increase in their old age dependency ratio between 2021 and 2030; ranging from 25.6 percent in Sekyere Afram Plains to 0.1 in Bosomtwi and Ejisu, while the others are projected to experience a decrease from 0.3 percent in Afigya Kwabre North and Ahafo Ano North to 12.7 percent in Sekyere Kumawu.
